

Site Inspection App – how a job moves through it

One inspection, six stages, five handovers. Every stage has exactly one owner at a time, and the record moves by file – there is no live sync.

01 The stage journey

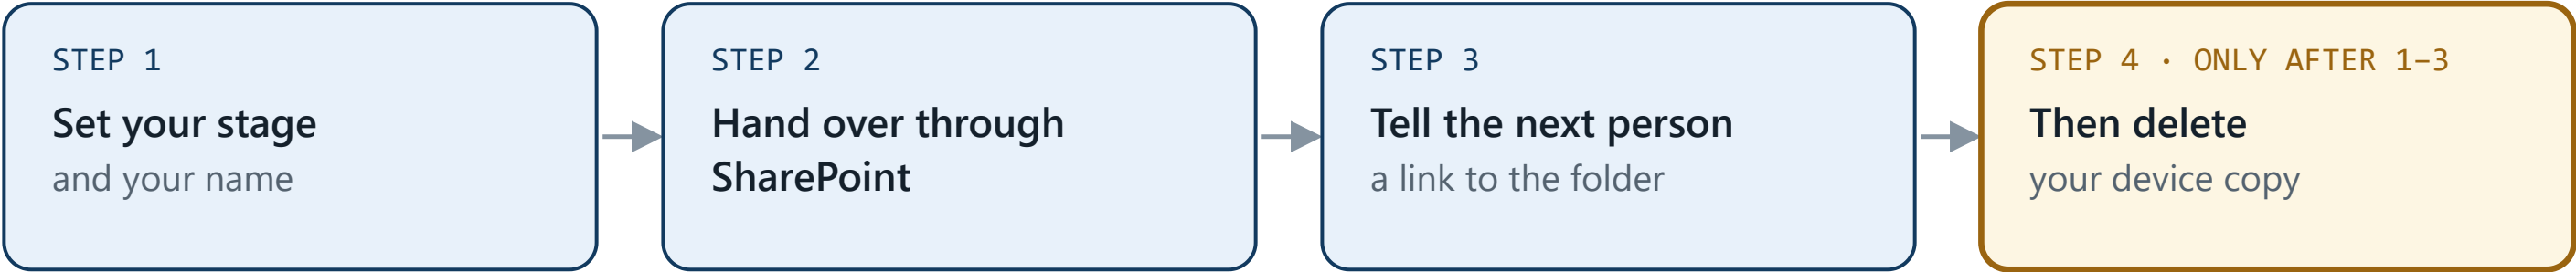

Each stage completes a defined part of the form and then hands the record on. The stage is recorded inside the record itself, so anyone opening it knows who holds it.

Sections 01–06 and 03A are completed on site; 07–12 are completed afterwards in the office. Blank fields are normal – the form is deliberately broader than any single job.

02 The handover — four steps, in this order

Because the record lives on each device, it can be copied, and two copies can drift apart. Exactly one file is the live record at any moment, and it lives in SharePoint. From v1.4 the app does the SharePoint filing itself — you set the stage, tap once, tell the next person, and then delete your copy.

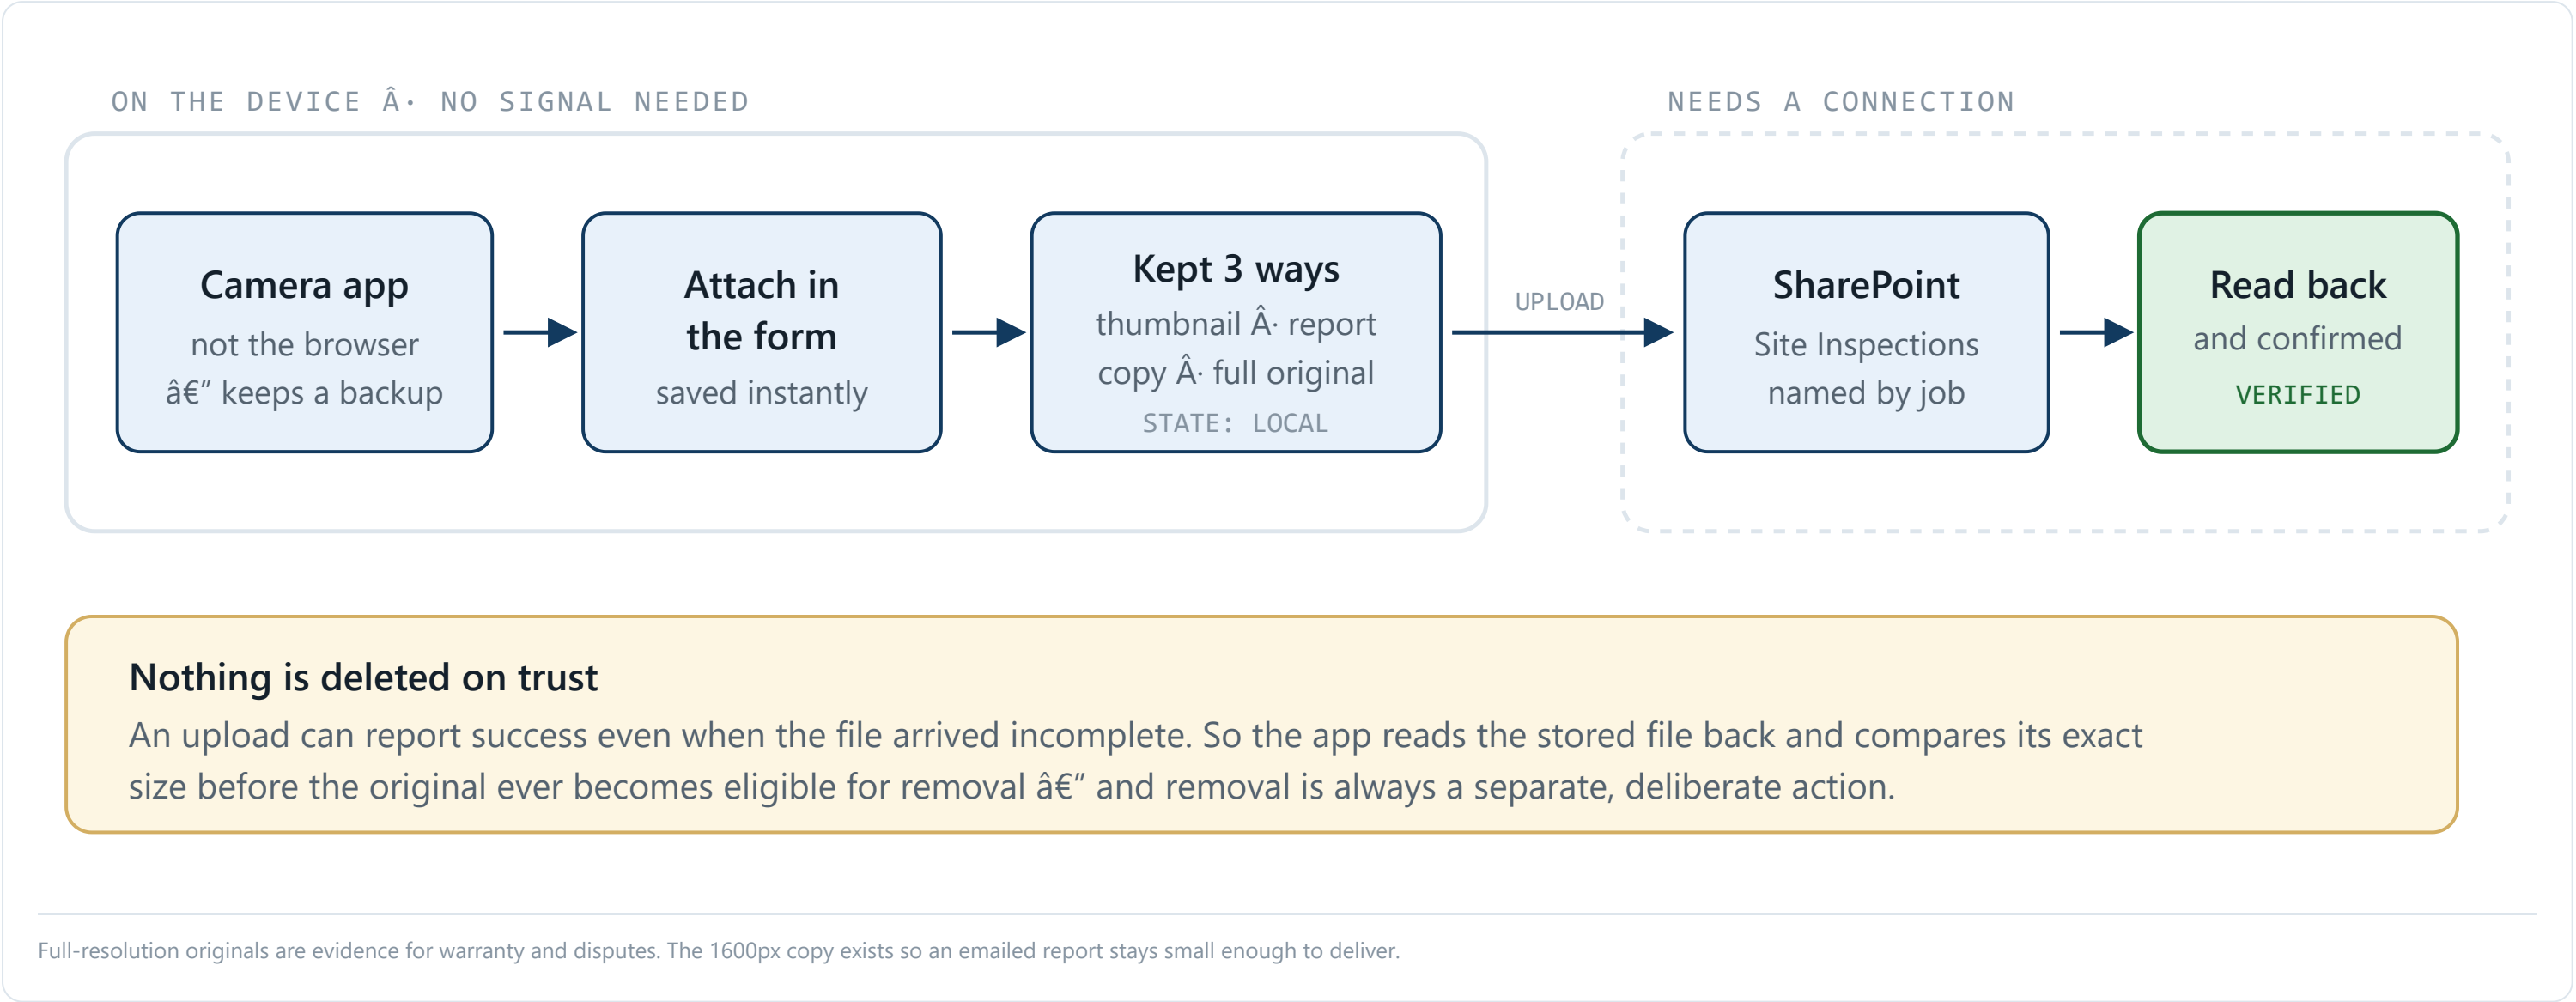

Step 2 does the filing for you.
It uploads the record into current/ and moves the previous version into archive/ — done by hand before v1.4, and impossible on a phone.

Files are named automatically, e.g. `DS_Draft_INS-2026-0142_Smith_S02-FIELD_2026-08-15T1430_JS.json` — job, stage, when, who. Skipping the last step is what creates two live copies that quietly disagree. Full detail is in [03_Handover and Version Control Protocol](#) §4.

03 What happens to a photo

Photos are captured in the basement where there is no signal, and travel to SharePoint later. Nothing is ever deleted from the device on the strength of an upload that has not been read back and confirmed.

04 Where the record goes next

The inspection sits at the front of the Critical Client Flow. Everything downstream reads from it, which is why a gap at inspection becomes a gap in the quote.

The sent report carries a hidden machine-readable data block, so the next system reads the answers directly and nothing is retyped.

05 Rules worth knowing

- It works with no signal at all**

Everything is stored on the device and saved within half a second – every keystroke, tick and photo. Losing signal, locking the screen or a flat battery does not lose data.
- Blank fields are normal**

The form is deliberately broader than any single job. Most inspections leave a lot blank, and that is correct. The completion counts exist to find genuine gaps, not to be driven to 100%.
- Use the installed icon, never a browser tab**

The app installs to the home screen. A browser tab may not keep its data the same way.
- Delete your device copy only after the handover is complete**

Steps 1 to 3 first. Deleting early, or not at all, is how two versions of one job start to disagree.
- Long video goes via OneDrive, not the app**

Photos are compressed automatically so reports stay deliverable. Video is too large to travel inside a draft or a report.
